Recursive Digit Sum

We define super digit of an integer \boldsymbol{x} using the following rules:

Given an integer, we need to find the super digit of the integer.

- If \boldsymbol{x} has only $\boldsymbol{1}$ digit, then its super digit is \boldsymbol{x} .
- Otherwise, the super digit of \boldsymbol{x} is equal to the super digit of the sum of the digits of \boldsymbol{x} .

For example, the super digit of 9875 will be calculated as:

```
super_digit(9875) 9+8+7+5 = 29

super_digit(29) 2 + 9 = 11

super_digit(11) 1 + 1 = 2

super_digit(2) = 2
```

You are given two numbers n and k. The number p is created by concatenating the string n k times. Continuing the above example where n=9875, assume your value k=4. Your initial p=9875 9875 9875 (spaces added for clarity).

All of the digits of p sum to 116. The digits of 116 sum to 8. 8 is only one digit, so it's the super digit.

Function Description

Complete the function *superDigit* in the editor below. It must return the calculated super digit as an integer.

superDigit has the following parameter(s):

- *n*: a string representation of an integer
- k: an integer, the times to concatenate n to make p

Input Format

The first line contains two space separated integers, n and k.

Constraints

- $1 \le n < 10^{100000}$
- $1 \le k \le 10^5$

Output Format

Return the super digit of p, where p is created as described above.

Sample Input 0

148 3

Sample Output 0

3

Explanation 0

```
Here n=148 and k=3, so P=148148148.

super_digit(P) = super_digit(148148148)
= super_digit(1+4+8+1+4+8+1+4+8)
= super_digit(39)
= super_digit(3+9)
= super_digit(12)
= super_digit(1+2)
= super_digit(3+2)
= 3.
```

Sample Input 1

9875 4

Sample Output 1

8

Sample Input 2

123 3

Sample Output 2

Explanation 2

```
Here n=123 and k=3, so P=123123123. 
 super_digit(P) = super_digit(123123123) \\ = super_digit(1+2+3+1+2+3+1+2+3) \\ = super_digit(18) \\ = super_digit(1+8) \\ = super_digit(9) \\ = 9
```
